

---

Contaminated materials must be disposed of in a safe and appropriate manner. Soils with elevated levels of heavy metals, especially lead, may be disposed of at the Page Depository or other Panhandle Health District (PHD) approved site.

- If a homeowner within the Bunker Hill Superfund Site wishes to dispose of one cubic yard of soil or less, PHD will supply a container and haul the soil to the Page Site at no charge.
- Quantities of contaminated soil greater than one cubic yard may be disposed of at the Page Site, but the homeowner is responsible for transporting it. Contaminated soils must be hauled to the Page Depository. All loads must be covered. Truck bed liners will be used when free water is present in the soils or if the soil is flowable. All hauling will be conducted during daylight hours and with the knowledge and permission of PHD.

Loads will be dumped in a drive away manner and all trucks will be dry brushed before leaving the Depository.

- Contaminated soils may be used as fill material if those soils will be covered by an approved barrier in their finished state. Soils with lead levels in excess of 350 ppm but less than 1000 ppm should be disposed of at the Page Site or other PHD authorized depository unless they are capped by an approved barrier.
- Non-soil contaminated materials such as insulation, carpeting, etc. shall be disposed of at a location approved by PHD.
